

## ABSTRACT OF THE DISCLOSURE

An image processing apparatus has first and second processors for performing first and second processings for image data received by a communication device. A data processing apparatus instructs for the image processing apparatus to execute the first and second processings for image data. When the image data and the instruction therefor are received, the image processing apparatus performs the first and second processings, and sends the image data processed by the second processor to the data processing apparatus, which replaces the received file with the transmitted file.
